Finger Exercises due Oct 27, 2022 07:30 +08 Completed

#### Exercise 2

3/3 points (graded)

#### **ESTIMATED TIME TO COMPLETE: 10 minutes**

Consider the following code:

```
x = 25
epsilon = 0.01
step = 0.1
guess = 0.0

while guess <= x:
    if abs(guess**2 -x) < epsilon:
        break
    else:
        guess += step

if abs(guess**2 - x) >= epsilon:
    print('failed')
else:
    print('succeeded: ' + str(guess))
```

Now suppose we try the following:

```
x = 25
epsilon = 0.01
step = 0.1
guess = 0.0
while guess <= x:
    if abs(guess**2 -x) >= epsilon:
        guess += step

if abs(guess**2 - x) >= epsilon:
    print('failed')
else:
    print('succeeded: ' + str(guess))
```

Select the answer that best describes what occurs when the above code is executed:

- Script successfully completes, but prints out succeeded: followed by some number not really close to 5.0
- O Script enters an infinite loop and never terminates

Now suppose we try

```
x = 25
epsilon = 0.01
step = 0.1
guess = 0.0
while abs(guess**2-x) >= epsilon:
   if guess <= x:
       guess += step</pre>
Hide Notes
```

```
else:
         break
 if abs(guess**2 - x) >= epsilon:
     print('failed')
     print('succeeded: ' + str(guess))
Select the answer that best describes what occurs when the above code is executed:
  Script successfully completes, and prints out | succeeded: 4.999999999999 (or | succeeded: 5.0 )
     Script successfully completes, but prints out failed
     Script successfully completes, but prints out succeeded: followed by some number not really close to
      5.0
      Script enters an infinite loop and never terminates
Finally, let's use the same code as immediately above, but change the first line to x = 23. Note that the square
root of 23 is roughly 4.7958.
Select the answer that best describes what occurs when the modified code is executed:
      Script successfully completes, but prints out failed
     Script successfully completes, but prints out succeeded: followed by some number not really close to
      5.0
     Script enters an infinite loop and never terminates
Hint: If any of the above answers confuse you, try running the code on your own machine and inserting print
statements to print out intermediate values of variables so you can examine what happens to certain variables -
for example, guess - as the program is executed.

 Step bigger than epsilon?!
                                                                                                             2
     While in the video professor explain the title with increment of order 0.001 with epsilon 0.01, we see steps of order 0.1 in the example...
  ? Can you really know the last two answers w/o running the code?
                                                                                                             9
     As stated above, I was wondering if there is a way to know the two answers without actually running the code? To me that seems im...
  ? For Q3, why is the last guess 23?
                                                                                                             3
     Lavacuted the eads for all in puthon tutor, and when visualizing the eads it mayor from if aux
